

The First Cause of a Slice

There can be several aspects of the golf swing that cause a slice, but if this is something you struggle with regularly, the first place to look is at your grip.

In the “bad” photo, notice the position of the left hand on the club – this is the grip that can cause a slice, because the left hand is not in a “strong” enough position.

In the photo on the right, the left hand is turned clockwise on the club so that the golfer can look down and see the first two knuckles of their left hand. This “strong” position will help square the clubface at impact and cause a straighter ball flight.

This change to the grip often feels uncomfortable to slicers, but if you can practice it and get used to it, you should find the ball is much less likely to slice!
